

What is Natural Gas?

Natural, Affordable, Domestic.

Geologic natural gas is the Earth's cleanest fossil fuel and is colorless, odorless, and non-toxic in its natural state.¹

Natural gas is used in a broad range of applications, including electricity generation, home heating, residential and industrial direct use, and as a transportation fuel.²

Low domestic natural gas prices have led to savings of almost \$50 billion for utility customers who have used natural gas over the past four years. Households that use natural gas for heating, cooking and clothes drying save an average of \$874 per year compared to homes using electricity for those applications.

Between 80 and 90 percent of the natural gas used in the United States is domestically produced.³
